

cattle bedding

A natural sand product that provides a comfortable and safe bedding surface for livestock. Reduces the spread of pathogens compared to other types of bedding media. Provides good traction reducing injuries from slips and falls. Is cooler than alternative types of bedding media, which helps reduce heat stress. Material is from both quarried and marine dredged sources and is available from a number of our UK locations.

applications:

- Animal Bedding

characteristic

Soft material free from sharp stones

Low dust levels

Provides good underfoot traction

Cooler than other forms of bedding media (straw, shavings, etc)

Inorganic product

Low silt content

result

Comfortable bedding surface

Less airborne dust resulting in safer environment for animals and people

Reduced injuries from slips

Reduces heat stress in livestock

Reduces bacterial growth and spread of pathogens. Reduced incidence of mastitis.

Free draining

manufacturing standard

BS EN 12620

provides a comfortable surface

A comfortable surface for your cattle & livestock to sleep on

low dust levels

Lower dust levels reducing the chance of respiratory problems for your livestock

reduced slipping underfoot

Anti-slip bedding underfoot - reducing accidents at work

cost efficient

Cost efficient solution due to ease of installation & replenishment

inorganic material

Inorganic materials used to prevent spread of bacteria

reduces heat stress

Cooler than alternative bedding and reduces heat stress to your livestock
